

VinTech Corp Quality Assurance Testing Procedure

VinTech Corp • Internal Document • Doc No. OPS-016 • Version 1.0

1. Purpose

This procedure describes the quality assurance (QA) process followed before VinTech Corp product releases.

2. Test Planning

For each release, the QA team creates a test plan covering new features, regression areas, and any high-risk areas identified by Engineering.

3. Test Levels

Testing includes automated unit and integration tests run on every code change, plus manual exploratory testing and a full regression pass before major releases.

4. Bug Triage

Bugs found during testing are logged in the issue tracker and triaged by severity: Critical bugs block the release until resolved; Major bugs require a documented decision from the release owner; Minor bugs may be deferred to a future release.

5. Release Sign-Off

A release is not deployed to production until QA provides sign-off confirming that all Critical and Major bugs identified during testing have been resolved or explicitly accepted by the release owner.

6. Post-Release Monitoring

After release, QA and Engineering monitor error rates and key metrics for 24 hours to catch issues not identified during pre-release testing, coordinating with the Change Management Process if a rollback is required.

7. Test Environment

QA testing is performed in a dedicated staging environment that mirrors production configuration as closely as practical, to reduce the risk of environment-specific defects.
